

Binary Search

1 Overview

1.1 Location \$<APPSDKSamplesInstallPath>\samples\opencl\cl\

1.2 How to Run

See the Getting Started guide for how to build samples. You first must compile the sample.

Use the command line to change to the directory where the executable is located. The precompiled sample executable is at $\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{100}{$<>}APPSDKSamplesInstallPath>\arraycolor{$

Type the following command(s).

- BinarySearch
 This searches an element in an array of 64 elements.
- BinarySearch -hThis prints the help file.

1.3 Command Line Options

Table 1 lists, and briefly describes, the command line options.

Table 1 Command Line Options

Short Form	Long Form	Description
-h	help	Shows all command options and their respective meaning.
	device	Devices on which the program is to be run. Acceptable values are cpu or gpu.
- q	quiet	Quiet mode. Suppresses all text output.
-e	verify	Verify results against reference implementation.
-t	timing	Print timing.
	dump	Dump binary image for all devices.
	load	Load binary image and execute on device.
	flags	Specify compiler flags to build kernel.
- p	platformId	Select the platformId to be used (0 to N-1, where N is the number of available platforms).
-d	deviceId	Select deviceld to be used (0 to N-1, where N is the number of available devices).
-V	version	AMD APP SDK version string.
-x	length	Length of the input array.

Binary Search 1 of 4

Short Form	Long Form	Description
-f	find	Element to be found.
-s	subdivisions	Number of subdivisions.
-i	iterations	Number of iterations for kernel execution.

2 Introduction

It finds the position of a given element in a sorted array. If the element is not present in the array that is reported too. Instead of a binary search where the search space is halved every pass, we divide it into N segments and call it N'ary search. While plain binary search has a computation complexity of log to base 2, N'ary search is log to base N.

3 Implementation Details

This is an N'ary search algorithm. For this particular implementation, the size of the array must be a multiple of 256. Consider 10000 (105) elements in sorted order from which an element must be searched. First, we divide the array into 10 segments of 10000 (10⁴) elements; then, we find the seament to which the element belongs and further divide the seament into 10 seaments of 1000 (10³) elements. Thus, we narrow our search space by subdividing the array.

For example, assume your input array is 2, 4, ...2*10⁵, and you are searching for 42:

The first pass consists of:

Thread 0: 2..2*10⁴ lower, upper bounds: 0, 10⁴

Thread 1: 2*10⁴+2..3*10⁴ lower, upper bounds: 10⁴, 2*10⁴

lower, upper bounds: 2*10⁴, 3*10⁴ Thread 2: 3*10⁴+2..4*10⁴

etc.

The value 42 is not between the lower-bound and upper-bound of any thread other than thread 0. Thus, only thread 0 writes to the output buffer. It writes its own lower bound, upper bound, and, since 42 is not equal to the lower bound element (2), it writes 0 in the third element.

The output array is 0, 10⁴, 0.

Similarly, the next pass has an output of 0, 10^3 , 0. The pass after that has an output of 0, 10^2 , 0.

Now the segment being searched in is 2, ... 200. Each segment is now 10 elements, so the threads are:

Thread 0: 2..20

Thread 1: 22..40

Thread 3: 42..60

This time only thread 3 writes to the output, and the third element is 1, meaning that the element is found.

The search is done, finding the index at which this element is present, and no further kernel calls are made.

If instead of 42 we were searching for 43, the subdivisions would go one step further, and the next pass would have 10 threads each being over a single element 42, 44, 46, etc.

Since 43 is not equal to any of them, and since the next subdivision's size is smaller than 1, the element can be said to not be present in the input array. So, no further kernel calls are made; the element has not been found.

The BinarySearch_kernels.cl file contains three kernel implementations: binarySearch, binarySearch_mulkeys, and binarySearch_mulkeysConcurrent. The sample implements the first kernel, and the preceding description applies to that kernel. The other two kernels are, as the name suggests, used for finding multiple keys at a time in the array.
